

Speed up Data Collection and Workflow.

WebForms™

Web-based fillable forms.

Get rid of paper forms and speed up data collection by using web-based fillable forms. WebForms allows you to web-enable HR documents, expense reports and other paper-based forms and easily capture, route and save the collected information in key business systems.

Form data can be saved to any database, ERP or ECM system. WebForms also allows you to digitally sign forms and route them through business processes.

And because WebForms automates data collection and electronically routes and saves forms, you save money on redundant data entry, and paper-related distribution and storage costs.

Save money by going paperless

WebForms can reduce or eliminate your paper shuffle and allow you to digitally store and manage collected data from business forms, surveys and other documents.

Easy access

Browser-based form enablement allows you to quickly deploy new forms as soon as they are designed. It also improves customer service and form completion rates by giving users the ability to fill out forms at their convenience.

Streamline workflow

WebForms speeds up workflow by taking the collected data and saving it to ERP, ECM and other business systems. You can also digitally, sign and route forms through a business process.

Automate data capture

Any paper-based form can be turned into a self contained data capture business process. Forms can be pre-populated from any database such as IBM i, SQL Server, Oracle, MySQL and more. Form data can also be written back to a database or web service after capture.

Business logic

You can create forms that contain business logic such as field validations. Database validations can also be incorporated into the business logic. Web service or program calls to any ERP application allow for seamless integration to your key ERP or other business systems.

Features:

- Automate data capture for any business form
- Speed up business processes
- Reduce redundant data entry
- Improve data accuracy
- Integrate into ERP, ECM and other systems
- Save money on paper-related printing, storage and distribution
- Enhance customer service
